[2]:

```python
import pandas as pd
data = { 'Name':['Varun','Ragha','Vaibhav'],
         'Age':[25,30,40],
         'Salary':[50000,60000,70000] }
df = pd.DataFrame(data)
print("DataFrame from Scratch:")
print(df)
df['Bonus']=df['Salary']*0.10
print("\nDataFrame after adding 'Bonus' column:")
print(df)
```

```
DataFrame from Scratch:
      Name  Age  Salary
0    Varun   25   50000
1    Ragha   30   60000
2  Vaibhav   40   70000

DataFrame after adding 'Bonus' column:
      Name  Age  Salary   Bonus
0    Varun   25   50000  5000.0
1    Ragha   30   60000  6000.0
2  Vaibhav   40   70000  7000.0
```

[4]:

```python
import pandas as pd
df=pd.read_csv('work experience.csv')
print("First 6 rows of DataFrame")
print(df.head(6))
print("\nColumn names and data types:")
print(df.info())
```

```
First 6 rows of DataFrame
   YearsExperience
0              1.1
1              1.3
2              1.5
3              2.0
4              2.2
5              2.9

Column names and data types:
<class 'pandas.DataFrame'>
RangeIndex: 9 entries, 0 to 8
Data columns (total 1 columns):
 #   Column           Non-Null Count  Dtype  
---  ------           --------------  -----  
 0   YearsExperience  9 non-null      float64
dtypes: float64(1)
memory usage: 204.0 bytes
None
```
